# MOTIVATION: Inundation in the Pacific Islands

Source: Hoeke et al 2013

Atoll Islands are low-lying, with much of the land area  $< 3$  m above mean sea level

Atoll Islands are vulnerable to a range of inundation hazards generated by atmospheric and oceanographic processes, including **typhoons and tropical storms** and **far-field generated swell**

# STEPS

- 1. CREATE A SUPER SPECTRA WITH ALL THE ENERGY APPROACHING THE ATOLL**
- 2. OBTAIN THE SPECTRAL PARTITIONINGS**
- 3. DEVELOP AN ALGORITHM TO AGREGATE SWELLS**
- 4. PARAMETERIZE SWELLS**
- 5. LINK SWELLS WITH WEATHER CONDITIONS**

CONCLUSIONS

# CONCLUSIONS

---

- IMPORTANCE OF AGGREGATING SPECTRAL INFORMATION AROUND THE STUDY ATOLL TO INCLUDE ALL SOURCES OF WAVE ENERGY
- NECESSITY TO CORRECTLY SIMULATE THE TIME EVOLUTION OF EVERY SWELL
- NEED OF EMULATE THE SWELL CHARACTERISTICS BASED ON THE ATMOSPHERIC SYSTEM THAT GENERATES THEM
